1 Implementation Details

Resizing of any selected region from a WSI to a specific size in pixels was performed by choosing the closest larger pyramidal representation of the region using Python OpenSlide and then resizing using Python OpenCV resize method with default interpolation. All code was written Python using PyTorch, Scikit-learn, and SciPy libraries.

Unsupervised Data Enrichment. When using an ImageNet pre-trained feature extractors, we normalized the images using ImageNet mean (0.485, 0.456, 0.406) and standard deviation (0.229, 0.224, 0.225) constants before passing the images into the feature extractor. However, we followed the pre-processing steps described by Li et al. [1] when using their networks pre-trained on lung subset of TCGA: used Instance Normalization instead of Batch Normalization inside the ResNet, and did not normalize the inputs. In both cases, we resized the smaller side of the query region to 224 pixels and cropped the central 224×224 square to extract the features.

Supervised Active Data Enrichment. We only used ResNet-18 pre-trained on patches extracted from the lung subset of TCGA at 10x magnification by Li et al. [1]. We used the same pre-processing as described in Method 1 for this feature extractor. Before training or validation we resized the smaller side of

the every region to 224 pixels. During training, we shuffled the dataset at every epoch, cropped a random 224×224 square from an image and used a random horizontal flip ($p=0.5$) to augment the data. During validation and testing we used the central 224×224 square without any flips.

2 Data Distribution

Batch	WSIs	ROIs	Keratinization	Acinar
(1) Hamamatsu, 20x	20	145	1	34
(2) Ventana DP200, 20x	17	120	15	20

Table 1: Data distribution between the first two batches. Two patterns were chosen for performing the experiments (unsupervised: keratinization, supervised: acinar).

Set	Batch	Samples	Yes	No	Not Sure	Yes Proportion
Train	1	86	20	31	35	0.233
Validation	1	59	14	21	24	0.237
Test	2	60	10	46	4	0.167
10 Ranked Pool	2	10	4	5	1	0.4
Train + 10 Ranked Pool	1+2	96	24	36	36	0.25
20 Ranked Pool	2	20	6	13	1	0.3
Train + 20 Ranked Pool	1+2	106	26	44	36	0.245
30 Ranked Pool	2	30	8	21	1	0.267
Train + 30 Ranked Pool	1+2	116	28	52	36	0.241
Pool	2	60	10	46	4	0.167
Train + Pool	1+2	146	30	77	39	0.205

Table 2: Data distribution for the acinar pattern.

3 Mathematical Formulation of the Proposed Ranking Curves; Expected Normalized AUC Calculation

3.1 Ranking Curve Definition

- Let inputs $\{x_1, \dots, x_N\}$ be already ranked by some ranking method that aims to put the inputs with the positive label (1) before (at lower indexes) the inputs with the negative label (0).
- Let $\{y_1, \dots, y_N\}$ such that $y_i \in \{0, 1\}$ for all $i \in \{1, \dots, N\}$ be the true labels with the total number of positive labels equal to t
- Let $p = t/N$ be the proportion of positive examples in our data.

$$t = \sum_1^N y_i \quad (1)$$

We define the ranking curve proportion $R(n)$ as follows for each $n \in \{1, \dots, N\}$

$$R(n) = \frac{\sum_1^n y_i}{\min\{n, t\}} \quad (2)$$

- The numerator is the number of positive examples in the top- n ranked samples: $\sum_1^n y_i$
- The denominator is the total number of positive samples that we could have possibly retrieved by taking n examples, which is $\min\{n, t\}$ since we can neither retrieve more positive examples than there are in total (t), nor can we retrieve more examples than we took (n)

3.2 Expected Performance on a Random Sample

If the examples are not in any particular order, the positive examples will be uniformly distributed within the indexes $\{1, \dots, N\}$ giving each index a probability $p = t/N$ of having a positive example. This means that for any sample of n randomly chosen examples we have:

$$\mathbf{E}[\sum_1^n y_i] = p \times n \quad (3)$$

Which results in:

$$\begin{aligned} \mathbf{E}[R(n)] &= \mathbf{E}\left[\frac{\sum_1^n y_i}{\min(n, t)}\right] \\ &= \frac{p \times n}{\min\{n, t\}} \\ &= \frac{(t/N) \times n}{\min\{n, t\}} \\ &= \begin{cases} t/N, & 1 \leq n \leq t \\ n/N, & t < n \leq N \end{cases} \\ &= \begin{cases} p, & 1 \leq n \leq t \\ n/N, & t < n \leq N \end{cases} \end{aligned} \quad (4)$$

Plotted as a function of n from 1 to N this results in a horizontal line for $1 \leq n \leq t$ and a line with $1/N$ gradient for $t < n \leq N$. The two lines have the common point when $n = t$, where $\mathbf{E}[R(n)] = t/N = p$.

$$AUC = (1 \times (N - 1))/2 + ((t - 1) \times p)/2 \quad (5)$$

Fig. 1: Expected Ranking Curve for $N = 8, t = 3, p = 3/8 = 0.375$

- $(N - 1)/2$ is the area of the right triangle between $(1, 0)$, $(N, 0)$, $(N, 1)$.
- $((t - 1) \times p)/2$ is the area of the right triangle between $(1, 0)$, $(1, p)$, (t, p) .

To calculate the Normalised AUC we change the x-axis from $[1, N]$ to $[0, 1]$ which results in

$$AUC = \frac{(1 \times (N - 1))/2 + ((t - 1) \times p)/2}{N - 1} = 0.5 + \frac{t - 1}{N - 1} \times \frac{p}{2}, \quad (6)$$

For the example on Figure 1, Normalized AUC = $0.5 + (2/7) \times (3/8)/2 \simeq 0.55$.

3.3 Lower Bound

If all the positive examples are ranked after all negative examples, i.e. $y_i = 0$ for $i \in \{1, \dots, N - t\}$ and $y_i = 1$ for $i \in \{N - t + 1, \dots, N\}$, then the Normalized AUC = $p/2$ because:

$$\begin{aligned} R(n) &= \frac{\sum_1^n y_i}{\min(n, t)} \\ &= \begin{cases} 0, & 1 \leq n \leq N - t \\ n - (N - t), & N - t + 1 \leq n \leq N \end{cases} \end{aligned} \quad (7)$$

This forms a right triangle between $(N - t, 0)$, $(N, 0)$, and $(N, 1)$ with an area of $(t \times 1)/2 = t/2$. When normalizing the x-axis from $[1, N]$ to $[0, 1]$, the area becomes $(t/2)/(N - 1)$.

For the example on Figure 2, Normalized AUC = $(3/2)/(8 - 1) \simeq 0.21$.

Fig. 2: Minimal Ranking Curve for $N = 8, t = 3, p = 3/8 = 0.375$

3.4 Upper Bound is 1

If all the positive examples are ranked before all negative examples, i.e. $y_i = 1$ for $i \in \{1, \dots, t\}$ and $y_i = 0$ for $i \in \{t + 1, \dots, N\}$, then the Normalized AUC = 1 because:

$$\begin{aligned}
 R(n) &= \frac{\sum_1^n y_i}{\min(n, t)} \\
 &= \begin{cases} n/n, & 1 \leq n \leq t \\ t/t, & t < n \leq N \end{cases} \\
 &= \begin{cases} 1, & 1 \leq n \leq t \\ 1, & t < n \leq N \end{cases} \\
 &= 1
 \end{aligned} \tag{8}$$
